Protected group bookings

- PactPay helps groups reserve a workshop or shared activity without asking one person to front the full amount.
- Everyone accepts their share before paying. Escrow applies the agreed payout and refund rules.
- Built for Portaldot Hacker House 2026.

Who has paid, and who gets a refund?

- An organizer may have to match transfers to chat messages and cover a shortfall when someone drops out.
- Participants need to know which terms they accepted, where their money is held and when they can get it back.
- A merchant needs to know whether the full booking amount is available before collecting it.

The group agrees before it pays

- The organizer creates a booking room and shares an invitation. Up to five contributors review their shares and accept the same revision.
- The organizer locks the agreement and opens payments. Each member authorizes their own contribution.
- The booking shows who has contributed, how much is held and whether a payout or refund is available to claim.

Booking and invitation walkthrough

What happens if the plan falls through?

- If four of five people pay 10 demo dUSD each and funding closes, the merchant cannot capture the 40 dUSD. Each contributor can settle and claim their own refund.
- If everyone pays and the merchant captures on time, a complaint window starts before payout.
- A buyer and merchant can sign a split settlement. An unresolved valid complaint can lead to a full refund of that buyer's share after the resolution deadline.

The network enforces the payment rules

- Portaldot V3 runs the Solidity escrow. Its runtime maps native Polkadot.js accounts to addresses that can interact with the contract.
- The contract enforces fixed shares, funding and capture deadlines, settlement and claims. The booking database handles invitations and consent.
- Finalized chain reads let reviewers check funding and claim outcomes independently of the booking database.

Deployment, payout and refund on V3

- Protected V2 deployed at block 314497. Chain ID 420420777.
- Merchant payout claim finalized at block 316348. Buyer refund claim finalized at block 316585.
- The video shows booking creation and invitation acceptance, then previews checkout. The links below lead to the separate finalized native transaction records.

Try the booking flow

- Start with the sample bookings and public receipts. A new testnet booking requires tPOT for network costs and demo dUSD for contributions.
- The app supports Polkadot.js and Google sign-in through Privy. The optional combined checkout lets a linked account use a selected native wallet to pay fees.
- Native payout and refund evidence is recorded. Full Google wallet and combined checkout flows still need end-to-end V3 verification.

What support would unlock

- Introductions to workshop organizers would help us test repeat bookings and observe where people get stuck.
- Portaldot integration support would help us verify Google wallet checkout and combined transactions end to end.
- An independent contract review would inform a limited pilot. We would measure how many groups fund on time, how much manual follow-up is needed and how easily participants complete refunds.
